

ABSTRACT

A coaxial connector (51) comprises a terminal (54) having a first end side connected to a mating  
5 connector (52) and a second end side connected to a central conductor (58) of a coaxial cable (53), an insulating member (55) provided outside the terminal and holding the terminal, and an outer conductor (56) provided outside the insulating member, wherein the terminal is held between a  
10 terminal (81) of the mating connector or holds the terminal of the mating connector such that a connection angle between the terminals of the coaxial connector and mating connector is made an obtuse angle.
